## Automotive Shipments Total 60 Trillion Yen; Equipment

 Investments, 1.4 Trillion Yen; R\&D Expenditures, 3.1 Trillion YenAutomotive shipments (both domestic and export shipments, including motorcycles, auto parts, etc.) in value terms reached 60 trillion yen in 2019, down $3.7 \%$ from the previous year, accounting for $18.6 \%$ of the total value of Japan's manufacturing shipments and $40.9 \%$ of the value of the machinery industries' combined shipments. Investments in equipment by the automobile industry in 2019 totalled 1.4 trillion yen and its research and development expenditures stood at 3.1 trillion yen those figures represent, respectively, more than $20 \%$ of the value of overall investments of Japan's major manufacturing sectors. With motor vehicle exports in value terms amounting to 12.8 trillion yen in 2020 and auto-related employment in Japan totalling 5.49 million people, the automotive industry is one of the Japanese economy's core industrial sectors.

## Auto-Related Employment Totals 5.49 Million People

Automobiles are the focus of an extremely wide range of industrial and related activity, from materials supply and vehicle production to sales, servicing, freight shipping and other auto-centered operations. Auto-related employment in Japan at present totals 5.49 million people.

Motor Vehicle Production Totals 8.07 Million Units
In 2020 motor vehicle production in Japan stood at 8.07 million units, down $16.7 \%$ from 2019, registering a decline for the second consecutive year. Passenger car production dipped $16.4 \%$ to a total of 6.96 million units, with standard cars decreasing $21.1 \%$ to 4.19 million units, small cars falling $8.3 \%$ to 1.41 million units, and minicars dropping $7.8 \%$ to 1.36 million units. Meanwhile, truck production declined $15.8 \%$ from the previous year to 1.04 million units and bus production sank $43.1 \%$ to 70,000 units.

## Used Vehicle Sales Total 6.87 Million Units

In 2020 sales of used motor vehicles shrank $1.7 \%$ from the previous year to 6.87 million units. Used passenger car sales totalled 5.74 million units, down $2.4 \%$ from the previous year, with small cars dropping $2.8 \%$ to 1.44 million units and minicars declining $4.4 \%$ to 2.40 million units, but standard passenger cars climbing $0.7 \%$ to 1.90 million units. Whereas sales of used trucks rose $1.2 \%$ to 1.04 million units, sales of used buses fell $5.3 \%$ to 12,000 units.

| Notes: 1. Passenger cars and trucks are classified under Japan's Road Vehicles Act in three categories, based primarily on engine capacity: "standard" (over 2,000cc), "small", ( $661 \mathrm{cc-}-2,000 \mathrm{cc}$ ), and "mini" " 660 cc and under); see page 23 for details. 2. Includes imported vehicles. 3, "Other" refers to emergency vehicles, special vehicles equipped with beds,refrigerated trucks, tank trucks, tractors, bulldozers, steamrollers, snowplows, snowmobiles, etc., that are assigned special registration numbers. 4 . "Chg. (\%)" means change from the previous year (with the previous year's result indexed at 100). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## A Total of 78.46 Million Motor Vehicles in Use

At the end of December 2020, motor vehicles in use in Japan (excluding motorcycles) totalled 78.46 million units, $0.1 \%$ increase over the previous year. Passenger cars in use increased $0.1 \%$ to 62.19 million units, with standard and minicars growing $1.6 \%$ and $0.8 \%$ to 19.92 million and 22.85 million units, respectively, but small cars dropping $2.2 \%$ to 19.4 million units. Meanwhile, trucks in use slipped $0.1 \%$ to 14.28 million units compared to the previous year and buses in use declined $3.1 \%$ from 2019 to 225,000 units. At the end of March 2020, the average service life of motor vehicles in Japan was 13.51 years for passenger cars, 15.31 years for trucks, and 18.31 years for buses.

## A Decline in Motor Vehicle Exports to All Regions

Motor vehicle exports decreased in 2020 from the previous year to North America ( 1.53 million units), Europe ( 676,000 units), Asia ( 560,000 units), Oceania ( 363,000 units), the Middle East ( 325,000 units), Latin America (178,000 units), and Africa (99,000 units).

MOTOR VEHICLE EXPORTS BY DESTINATION IN 2020

## Motorcycle Production Totals 485,000 Units

Overall domestic motorcycle production in 2020 declined $14.6 \%$ from the previous year to 485,000 units. By engine capacity, there was a decrease in production in every category, with Class 1 motor-driven cycles ( 50 cc and under) falling $6.7 \%$ to 122,000 units, Class 2 motor-driven cycles ( 51 cc to 125 cc ) shrinking $19.7 \%$ to 39,000 units, mini-sized motorcycles ( 126 cc to 250 cc ) dipping $1.4 \%$ to 54,000 units, and small-sized motorcycles (over 250 cc ) declining $19.1 \%$ to 270,000 units. The combined total for larger motorcycles (all those over 50cc) dropped 17.0\% to 362,000 units.

## Motorcycle Sales Total 366,000 Units

Domestic motorcycle sales in 2020 finished at 366,000 units, up $1.0 \%$ from the previous year. By engine capacity, whereas sales of Class 1 motor-driven cycles ( 50 cc and under) fell $7.3 \%$ to 122,000 units and sales of Class 2 motor-driven cycles ( 51 cc to 125 cc ) dipped $3.5 \%$ to 102,000 units, sales of mini-sized motorcycles ( 126 cc to 250 cc ) and small-sized motorcycles (over 250 cc) climbed $27.5 \%$ to 74,000 units and $1.4 \%$ to 67,000 units, respectively. Overal sales of motorcycles with engine capacity over 50cc totalled 244,000 units, an increase of 5.8\% over 2019.

### 10.35 Million Motorcycles in Use

At March 31, 2020, motorcycles in use in Japan totalled 10.35 million units, down $1.8 \%$ from the previous year. By engine capacity, Class 1 motor-driven cycles, accounting for $46.9 \%$ of all motorcycles in use, dropped $4.9 \%$ to 4.85 million units in 2020, whereas Class 2 motor-driven cycles, mini-sized motorcycles, and small-sized motorcycles in use rose $1.7 \%, 0.2 \%$, and $1.4 \%$ to 1.82 million units, 1.97 million units, and 1.71 million units, respectively. Thus, motorcycles over 50 cc in use increased $1.1 \%$, to a total of 5.50 million units.

## Motorcycle Exports Total 312,000 Units

Motorcycle exports in 2020 decreased $21.3 \%$ from the previous year to 312,000 units. By engine capacity, Class motor-driven cycles fell $3.4 \%$ to 16,000 units, mini-sized motorcycles dropped $15.7 \%$ to 41,000 units, and small-sized motorcycles shrank $25.1 \%$ to 230,000 units. Meanwhile, Class 2 motor-driven cycles rose $3.7 \%$ to 25,000 units.

## An Increase in Motorcycle Exports to Oceania and the Middle East

Compared to the previous year, motorcycle exports in 2020 increased to Oceania ( 23,000 units) and the Middle East ( 5,000 units), but decreased to Europe ( 144,000 units), North America ( 95,000 units), Asia ( 23,000 units), Latin America ( 13,000 units), and Africa ( 9,000 units).

## Promoting Greater Road Safety

Road safety involves three factors-road users, vehicles, and road infrastructure. Accordingly, those three factors are the focus of JAMA's and its member manufacturers' road safety promotional efforts (for the manufacturers' vehicle-based measures for increased active and passive safety, see page 14). JAMA works together with relevant government agencies and organizations on activities promoting greater road safety. In 2020 road fatalities (defined here as deaths occurring within 24 hours of accident occurrence) in Japan dropped to 2,839 , the lowest number recorded since the start of road fatality data compilation by the National Police Agency in 1948. Road accidents and road injuries also declined, for the sixteenth consecutive year, to 309,178 and 369,476 (in number of persons), respectively; the injured included 27,774 people with serious injuries. Annual statistics show that while the road fatality rate per 100,000 persons continues to decline for the elderly demographic (ages 65 and older), that age group nevertheless accounts for a growing share- $56.2 \%$ in 2020 -of total road fatalities. Reducing the fatality rate among older road users therefore remains a pressing issue.

ROAD ACCIDENTS/INJURIES/FATALITIES

| Year | Accidents | Injuries (Number of persons) | Fatalities (Number of persons) |
| :---: | :---: | :---: | :---: |
| 1970 | 718,080 | 981,096 | 16,765 |

## Widespread Application of Advanced Safety Vehicle Technologies

## EXPANDING AVAILABILTY OF ASV TECHNOLOGIES IN THE MARKET

With the goal of supporting safe driving, the results of research conducted on the Advanced Safety Vehicle (ASV) concept have been used to develop a wide range of vehicle safety features, including lane-keeping assist systems, full-range adaptive cruise control systems and collision-mitigation braking systems. Most of these advanced technologies have already been introduced to the market (see page 14 for details on the status of their onboard installation).

PRACTICAL APPLICATION OF ASV TECHNOLOGIES

2. Full-Range Adaptive Cruise Control
2. Furf-Rantion from front sensors helps a vehicle keep a safe distance from the
fericice ahead through brake or speed control according to a preset vehicle
speed.

Collision-Mitigation Braking System (pre-crash safety)
Based on the distance from and speed relative to the vehicle ahead obtained princiaplly by means of radar technology, the system's electronic control unit calculates
the risk of collsion the risk of collision. In the event of such a risk, multiple warnings are emitted and
auxiliary braking is applied. When a collision is imminent, full braking power is applied and seatbelts are retracted automatically.
 are emitted and auxiliary braking is automatically applied.

$$
\begin{aligned}
& \text { When a collision is iminent, full braking power is automatically applied and } \\
& \text { seatbelts are rapidy retracted. }
\end{aligned}
$$

## PROMOTING PUBLIC AWARENESS OF "SAFETY SUPPORT CARS"

Japan's Ministry of Economy, Trade and Industry, Ministry of Land, Infrastructure, Transport and Tourism, National Police Agency, Financial Services Agency and automobile-related organizations have been working cooperatively to promote the widespread use of "safety suppor cars" (or "sapocars" for short), equipped with advanced safety features such as collision-mitigation braking systems, to help drivers of all ages avoid road accident occurrence and to mitigate damage/injury when accidents do occur.

THE "SAFETY SUPPORT CAR" Ver 1.0 CONCEPT

## Equipping More Vehicles with Advanced Safety Features

The automotive industry continuously strives for greater active safety by upgrading vehicle safety equipment and expanding its onboard installation rates, to help prevent accident occurrence. For example, $95.8 \%$ of the totality of passenger cars produced in 2020 for the domestic market were equipped with forward collision-mitigation braking systems (including those for low-speed vehicle operation) and $90.8 \%$ with systems enabling accelerator suppression in the event of pedal misapplication. Automakers also continuously seek to increase passive safety through enhanced structural safety and vehicle features designed to mitigate injury when accidents do occur.

SAFETY FEATURE ONBOARD INSTALLATION STATUS
(for passenger cars produced in 2020 for home market)

|  | Safety Feature | Installation Status |  |  |  |  |

## The Transition to Automated Driving

Aiming for the real-world implementation of automated driving, the Japanese government released, in April 2018 an outline of the system-building measures needed to create the legal frameworks necessary for the practical application of automated driving technologies (Level 3) by the year 2020. A subsequent review of road traffic-related frameworks conducted on the basis of that outline by the ministries and agencies concerned led to the enactment in early 2020 of a revised Road Traffic Act and a revised Road Vehicles Act. The government's Public-Private ITS Initiative/Roadmaps policy initiative, which represents Japan's strategy on ITS and automated driving systems development, formulates a plan to marketize automated driving systems (Level 4) on expressways, expand their use in freight transport, and promote the introduction of driverless autonomous mobility services by 2025. JAMA is actively participating in the initiatives being undertaken for the practical use of automated driving technologies.

INITIATIVES PROMOTING THE COMMERCIALIZATION OF AUTOMATED DRIVING SYSTEMS AND THE INTRODUCTION OF AUTONOMOUS MOBILITY SERVICES

[^0]JAMA'S VISION OF AUTOMATED DRIVING
In November 2015, JAMA released a roadmap for achieving optimally safe, accessible, and efficient mobility for all road users in Japan through the use of automated driving technologies. The roadmap envisions the wider introduction of automated driving functions up to 2020; between 2020 and 2030, the expanded application of automated driving technologies in various driving environments; and by 2050, predicated on full public acceptance which Japan's automakers will promote, a comprehensive deployment of advanced levels of automated driving, the result of integrated efforts on the part of industry, government, and academia.

| ACHIEVING THE "ZEROS" | Zero accidents | Through the elimination of human error | Driverassistance systems | Automated driving functions |
| :---: | :---: | :---: | :---: | :---: |
|  | Zero congestion | Through more efficient road and vehicle use (via telematics) |  |  |
| RESOLVING RELATED ISSUES | Enabling optimally accessible mobility | Through optimally efficient door-to-door vehicle use, "any time and anywhere" |  |  |
|  | Enabling optimally efficient freight transport |  |  |  |

## Striving to Reach Net-Zero

The Japanese government has declared the country's intention to achieve carbon neutrality (CN) by 2050. As part of this effort, one goal is to raise the share of electrified (i.e., electric or partially electric) vehicles in annual new passenger car sales in the domestic market to $100 \%$ by 2035, and comprehensive steps are being taken accordingly. Japan's automotive industry is engaging with $\mathrm{CO}_{2}$ reduction efforts being rapidly deployed globally and is working vigorously towards the "net zero $\mathrm{CO}_{2}$ emissions" target.

THE WORLDWIDE SHIFT TOWARDS CARBON NEUTRALITY
Governments around the world must reduce greenhouse gas (GHG) emissions in order to limit global warming within this century to "well below $2^{\circ} \mathrm{C}$ and preferably to $1.5^{\circ} \mathrm{C}^{\prime \prime}$ compared to pre-industrial levels, as called for by the Paris Agreement, the international treaty on climate change adopted in December 2015. Moreover, a special report released by the Intergovernmental Panel on Climate Change (IPCC) in 2018 on "Global Warming of $1.5^{\circ}{ }^{\circ}$ " affirmed that carbon neutrality must be achieved by around 2050 in order to keep the global temperature rise to within $1.5^{\circ} \mathrm{C}$ above pre-industrial levels. Against this backdrop, there is growing international momentum to achieve carbon neutrality as more and more countries and regions establish increasingly ambitious CN targets.

CARBON NEUTRALITY TARGET YEARS \& RELATED GOVERNMENT STATEMENTS, JAPAN/U.S.A./EU

|  | Target Year | Related Statement |
| :---: | :---: | :---: |
| Japan | 2050 as declared in Prime Minister Suga's policy speech $\qquad$ | "My administration will devote itself to the greatest possible extent to bring about a green society, while focusing on a virtuous cycle of the economy and the environment as a pillar of our growth strategy. [ Addressing climate change is no longer a constraint on economic growth. We need to adjust our mindset to a paradigm shift [so] that proactive climate change measures bring transformation of industrial structures as well as our economy and societt, leading to dynamic economic growth." |
| U.S.A. | 2050 (as declared in candidate Joseph Biden's July 2020 campaign pledge) | "Today, President Biden will [issue an Executive Order] to tackle the climate crisis at home and abroad while creating good-paying union jobs and equitable clean energy future, building modern and sustainable infrastructure, [and] restoring scientific integrity and evidence-based policymaking across the federal government. [...] The order clearly establishes climate considerations as an essential element of U.S. foreign policy and national security." <br> - Extract from "Fact Sheet" issued by White House Briefing Room, January 27, 2021 |
| EU | 2050 <br> (EU Long-Term Strategy submission, March 2020) | "The European Green Deal will transform the EU into a modern, resource-efficient and competitive economy, ensuring: <br> - no net emissions of greenhouse gases by 2050 • economic growth decoupled from resource use <br> - no person and no place left behind." <br> - Extract from "A European Green Deal" issued December 11, 2019 |

- LIFE CYCLE ASSESSMENT

Life cycle assessment (LCA) is a methodology for quantitatively calculating the environmental impacts of a product (or process or service) throughout its entire life cycle, from the initial procurement of raw materials through product disposal. Although electric vehicles and fuel cell vehicles, for example, emit no $\mathrm{CO}_{2}$ when driven, carbon is emitted in the generation of electricity and the production of hydrogen which they use, respectively, as fuel; and carbon emissions are also produced during their manufacture, distribution, recycling, and disposal at the end of their service life. LCA thus makes possible th reduction of $\mathrm{CO}_{2}$ emissions at every stage of a vehicle's life cycle, without which carbon neutrality with respect to motor vehicles cannot be achieved.

In vehicle life cycle assessment, $\mathrm{CO}_{2}$ emission volumes are calculated at every stage of a vehicle's life cycle, from power generation and manufacture through distribution, use, an final disposal.

Note: The illustration at left does not take into
account hydrogen production
Source
the Environment

VEHICLE USERS AND CARBON NEUTRALITY: CONSUMER OPTIONS IN JAPAN
Life cycle assessment calculations have determined that, because the supply of renewable energy in Japan is for the time being limited, there is not a wide disparity in $\mathrm{CO}_{2}$ emissions tallies for hybrid vehicles (HVs), electric vehicles (EVs), and fuel cell vehicles (FCVs) over their entire life cycles. The widespread use of electric vehicles will help expedite the achievement of carbon neutrality, but it is crucial that consumer preferences be taken into account. At present, the vehicle market in Japan offers consumers a wide range of electrified models, enabling consumers to make the vehicle purchasing choices that best suit their needs.

CURRENT STATUS OF ELECTRIFIED PASSENGER VEHICLE ADOPTION \& JAPAN'S TARGETS FOR 2030 Electrified vehicles (HVS/PHVS/EVS/FCVS) accounted for $36 \%$ of new passenger car sales in Japan in 2020. For 2030, the Japanese government has established a target of 50 to $70 \%$ of new passenger car sales for so-called next-generation vehicles (HV//PHVs/EVs/FCVs and clean diesel vehicles),

## Climate Change and CO2 Emissions Reduction: The Response of the Transport Sector

In 2019 Japan's CO2 emissions totalled 1.11 billion tons (actual figure), of which the transportation sector accounted for nearly 19\%. Since peaking in 2001 following a decade of growth, CO2 emission volumes in Japan's transport sector have steadily declined, owing largely to increased fuel efficiency in passenger cars and greater efficiency in goods distribution. The automobile industry will continue to vigorously promote $\mathrm{CO}_{2}$ emissions reduction in road transport by further improving vehicle fuel efficiency and expanding the market supply of next-generation vehicles.

CO2 EMISSIONS IN JAPAN
The transportation sector accounts for nearly $19 \%$ of Japan's total CO2 emissions, which in 2019 amounted to 1.11 billion tons (actual figure).

TRENDS IN CO2 EMISSION VOLUMES IN JAPAN'S TRANSPORT SECTOR, BY MODE
Motor vehicle-emitted $\mathrm{CO}_{2}$ accounts for about $86 \%$ of the totality of $\mathrm{CO}_{2}$ emitted by Japan's transport sector. CO e emissions from road transportation in Japan have seen a significant decrease since transport-sector emissions peaked in 2001.

## Attention to the Environment

Vehicle Fuel Efficiency

## CO2 Emissions Reduction: Improving Vehicle Fuel Efficiency

Fuel efficiency targets for passenger cars, trucks, and buses are formulated by applying "top runner" criteria whereby the target value for a given vehicle weight category is established based on the leading fuel efficiency performance to date for that weight category. To comply, first, with stringent 2015 average fuel efficiency targets for small trucks and buses and heavy-duty vehicles as well as with a 2020 target for passenger cars and, subsequently, with an even stricter 2022 target for small trucks, 2025 targets for heavy-duty vehicles, and a 2030 target for passenger cars, JAMA member manufacturers have been making continuous efforts to increase the fuel efficiency of conventional vehicles and expand the supply of alternative-energy vehicles. Calculation of the average fuel efficiency target of $25.4 \mathrm{~km} / \mathrm{L}$ (a $32.4 \%$ increase over the actual value in 2016) established for 2030 for new passenger cars took into account, for the first time, the fuel efficiency performances of electric vehicles and plug-in electric vehicles.

VEHICLE TECHNOLOGIES FOR INCREASED FUEL EFFICIENCY

## In-Use Status of Next-Generation Vehicles

Since 2009, when the government's tax incentive/subsidy programs for the purchase of eco-friendly vehicles were first introduced, new registrations of (so-called in Japan) next-generation vehicles-including hybrid, plug-in hybrid, electric, fuel cell, clean diesel, and other new-energy vehicles-have been steadily increasing. As a result of each automaker's efforts to develop a range of such models, the share of next-generation vehicles in new passenger car registrations in 2020 exceeded $39 \%$. The more widespread use of these vehicles requires not only further advances in vehicle and related technologies, but also, among other government initiatives, the establishment of the necessary fuel/energy supply infrastructures and the continued provision of purchasing incentives.

## Voluntary Initiatives to Eliminate the Use of Four Heavy Metals in Motor Vehicles

JAMA member manufacturers have, on a voluntary basis, eliminated the use of four heavy metals-lead, mercury, hexavalent chromium and cadmium-in new vehicles to lessen their environmental impact, particularly when they are dismantled and processed at the end of their service life. Restrictions on the use of these substances in motorcycles have been established separately.

RESTRICTIONS ON THE USE OF FOUR HEAVY METALS IN NEW VEHICLES \& COMPLIANCE STATUS

| Substance | Restrictions | Compliance Status |
| :---: | :---: | :---: |
| Lead | As of January 2006, a 90\% decrease or more from the 1996 level of 1,850 grams (i.e., a maximum permissible level of 185 grams).* For large commercial vehicles including buses, a $75 \%$ decrease or more from the 1996 level. *Batteries are exempt. | All models have complied since January 2006. |
| Mercury | As of January 2005, banned except for trace amounts in safety-related components such as: <br> - Instrument panel displays <br> - Liquid crystal displays in navigation devices <br> - Discharge lamps <br> - Fluorescent cabin lamps | All models have complied since January 2003. Components listed here in the left column are now mercury-free in all models. |
| Hexavalent chromium | Banned as of January 2008. | All models are in compliance. |
| Cadmium | Banned as of January 2007. | All models have complied since January 2006. |

## A Voluntary Approach to Reducing Vehicle Cabin VOCs

New-model passenger cars marketed in and after 2007 and new-model commercial vehicles sold in and after 2008 have met the target values established in January 2002 by Japan's Ministry of Health, Labor and Welfare for indoor concentration levels of 13 volatile organic compounds (VOCs; see table below). To measure VOC concentration levels in vehicle cabin air, JAMA-developed in-cabin test procedures covering passenger cars as well as trucks and buses were introduced in 2005. However, JAMA's test procedure for passenger cars was replaced by ISO 12219-1 when the latter was established, in July 2012, as the global standard for testing in-cabin VOCs in passenger cars. On the other hand, JASO test methods based on the JAMA procedure for measuring in-cabin VOC concentration levels in trucks and buses (which are not covered by the ISO standard) remain in application. Meanwhile, automakers are continuously working to achieve further reductions in in-cabin VOC concentration levels. This voluntary initiative applies only to vehicles that are manufactured and sold in Japan.

TARGET VALUES FOR INDOOR CONCENTRATION LEVELS OF 13 SUBSTANCES (VOCs) (established in January 2002)

| Substance | Target Value for Indoor Concentration Level | Principal Sources |
| :---: | :---: | :---: |
| Formaldehyde | $100 \mu \mathrm{~g} / \mathrm{m}^{3}$ (0.08 ppm) | Adhesives for p |
| Toluene | $260 \mathrm{mg} / \mathrm{m}^{3}(0.07 \mathrm{ppm})$ | Adhesives/paints for interior finishing materials, furriture, etc. |
| Xylene | $870 \mu \mathrm{~g} / \mathrm{m}^{3}(0.20 \mathrm{ppm})$ | Adhesives/paints for interior finishing materials, furriture, etc. |
| Paradichlorobenzene | $240 \mathrm{gg} / \mathrm{m}^{3}(0.04 \mathrm{ppm})$ | Moth repellents, lavatory air fresheners |
| Ethylbenzene | $3,800 \mu \mathrm{~g} / \mathrm{m}^{3}(0.88 \mathrm{ppm})$ | Adhesives/paints for plywood, furniture, etc |
| Styrene | $220 \mathrm{gg} / \mathrm{m}^{3}(0.05 \mathrm{ppm})$ | Insulation materials, bath units, tatami-mat core materials |
| Chlorpyrifos | $1 \mathrm{\mu g} / \mathrm{m}^{3}(0.07 \mathrm{ppb})$ | Insecticides (esp. ant exterminators) |
| Di-n-butyl phthalate | $220 \mathrm{gg} / \mathrm{m}^{3}(0.02 \mathrm{ppm})$ | Paints, pigments, adhesives |
| Tetradecane | $330 \mathrm{gg} / \mathrm{m}^{3}(0.04 \mathrm{ppm})$ | Kerosene, paints |
| Di-2-ethylhexyl phthalate | $120 \mu \mathrm{~g} / \mathrm{m}^{3}(7.6 \mathrm{ppb})$ | Wallpaper, flooring materials, wire-coating materias |
| Diazinon | $0.29 \mu \mathrm{~g} / \mathrm{m}^{3}(0.02 \mathrm{ppb})$ | Pesticides |
| Acetaldehyde | $48 \mu \mathrm{~g} / \mathrm{m}^{3}(0.03 \mathrm{ppm})$ | Adhesives for construction materials, wallpaper, etc. |
| Fenobucarb | $33 \mathrm{gg} / \mathrm{m}^{3}(3.8 \mathrm{ppb})$ | Insecticides (esp. termite exterminators) |

## Vehicle Recycling and Waste Reduction

Under Japan's End-of-Life Vehicle (ELV) Recycling Law which entered into force in January 2005, automobile manufacturers and importers are responsible for recovery, recycling and appropriate disposal with respect to fluorocarbons, airbags, and automobile shredder residue (ASR). Compliance with the law was anticipated to enable ASR to be recycled at a rate of $70 \%$ by 2015, resulting in an automobile recycling rate, by vehicle weight, of $95 \%$ (as compared with the $80 \%$ rate prevailing prior to the introduction of the law); those rates were in fact surpassed in 2008. Japan's vehicle recycling infrastructure as mandated by its ELV Recycling Law is the first in the world to administer the entire process of auto recycling-from ELV recovery to final disposal-on the basis of electronic "manifests" (or compliance checklists). In line with legislative provisions promoting the so-called $3 R$ initiatives ("reduce, reuse, and recycle"), Japan's automakers are also striving to design vehicles using lightweight materials that are easy to dismantle and recycle, and to reduce and recycle waste generated in the manufacturing process. In 2019 the volume of auto plant-generated waste destined for landfill disposal totalled 400 tons. Having long surpassed the target of 1,000 tons set for 2020, JAMA members will nevertheless continue to promote the reduction of plant-generated waste for landfill disposal.

INDUSTRY MEASURES IN LINE WITH NATIONAL LEGISLATION

## Global Harmonization in the Regulation of Vehicle Exhaust Emissions

Japan's vehicle exhaust emissions regulations have always been among the world's most stringent, and its automakers have worked very hard to develop the advanced technologies required to comply with them. As a result, NOx and other atmospheric pollutant levels have been, even in large urban areas, on a steady decline. Japan has participated in international discussions on the global harmonization of emission test cycles and in 2010 introduced the UN tes cycle for motorcycle emissions. In 2018 Japan adopted the UN "WLTC" to measure emissions from new gasoline-powered passenger cars and light commercial vehicles, following its adoption in 2016 of the UN "WHTC" for measuring diesel exhaust emissions from new heavy-duty vehicles (see corresponding notes below).

MOTOR VEHICLE EMISSIONS REGULATIONS IN JAPAN

## Japan's Test Cycles for Measuring Fuel Consumption and Exhaust Emissions

Japan not only promotes the international standardization of test cycles for measuring motor vehicle fue consumption and $\mathrm{CO}_{2}$ and other emissions but has actively contributed to the development of the Worldwide Harmonized Light Vehicle Test Cycle (also referred to as the Worldwide Harmonized Light-Duty Test Cycle), or WLTC under the United Nations' World Forum for Harmonization of Vehicle Regulations. In line with that initiative, Japan is now in the process of replacing its JCO8 test cycle for passenger cars and other non-heavy-duty vehicles with WLTC. WLTC incorporates three driving cycles: the "urban, rural and expressway modes," as they are called in Japanese The indication wherever necessary of fuel consumption rates measured in the three driving "modes" as well as their certified mean (i.e., average) rate has been required since October 2018.

COMPARISON OF THE JC08 TEST CYCLE AND WLTC FOR LIGHT VEHICLES

- HOW LIGHT-VEHICLE FUEL CONSUMPTION RATES (EXAMPLES) ARE INDICATED IN JAPAN

Measured on the basis of the JC08 test cycle
Fuel consumption rate (1) certified the Ministry of Land, Infrastructure, Transport and Tourism

## JC08モ-s $21.4_{\mathrm{km} / \mathrm{L}}$

(1) Fuel consumption rates are obtained on the
basis of designated test conditions. in real-world on-road driving, rates will vary as a
result of multiole factors (weather and traftic result of multiple factors (weather and traffic
conditions, driving behavior, use of air conditioner, etc.).

Measured on the basis of WLTC
by the Ministry of Land, Infrastructure, Transport and Tourism

| WLTC $_{\text {玉-F }}(2)$ | Urban mode $_{(2)}$ | $15.2 \mathrm{~km} / \mathrm{L}$ |
| :--- | :--- | :--- |
| $20.4 \mathrm{~km} / \mathrm{L}$ | Rural mode $_{(2)}$ <br> Expressway mode $_{(2)}$ | $21.4 \mathrm{~km} / \mathrm{L}$ |
| $23.2 \mathrm{~km} / \mathrm{L}$ |  |  |

(1) Fuel consumption rates are obtained on the basis of designated test conditions. 1 rea- worls on-road driving, rates will vary as a result of multiple factors (weather and traffic conditions, driving behavior, use of air conditioner, etc.).
(2) WLTC is an international test cycle incorporating urban, rural and expressway driving cycles or "modes" with specific time durations designated for each mode.
Urban mode: (Assumptions) Low-speed driving characterized by frequent stops and starts
Rural mode: (Assumptions) Steady driving characterized by fewer stops and starts owing to Expressway driving mode: (Assumptions) ligh-spesed driving typpical of highiway driving

## 9 Trillion Yen in Annual Automobile-Related Tax Revenue

Since the initial earmarking of funds for road construction and road maintenance programs in line with Japan's first five-year road improvement plan in 1954, there has been a steady increase both in the number of automobile-related taxes assessed on users and in their respective rates. Currently, the automobile tax structure consists of nine different taxes, creating a very heavy tax burden for motor vehicle owners in Japan. Under the government's budget for fiscal 2021, the total value of tax revenue from these automobile-related taxes has been estimated at 9.0 trillion yen, or $8.7 \%$ of Japan's projected total tax revenue of 99 trillion yen in fiscal 2021.

TAX REVENUE (Estimated) BY SOURCE IN FISCAL 2021

JAPAN'S ESTIMATED AUTOMOBILE-RELATED TAX REVENUE IN FISCAL 2021

2. Current tax rates effective as of May 1 1, 2021 .

## Tax Incentives to Promote the Wider Use of Eco-Friendly Vehicles

To help expedite the shift to low-carbon road transport in the interest of curbing global warming and to help improve air quality, the Japanese government has, since April 2009, applied auto-related tax incentives to promote the wider use of eco-friendly vehicles. Updated incentives and eligibility requirements came into effect in April and May 2021 and their effective periods were extended for two years. Incentives for the acquisition tax expired at the end of September 2019 when the acquisition tax was abolished.

## INCENTIVES \& ELIGIBILITY REQUIREMENTS

TONNAGE TAX REDUCTIONS/EXEMPTIONS
Period in effect: May 1, 2021 through April 30, 2023.

1. Passenger Cars

|  | Requirements | When Imposed | Reductions/Exemptions |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| - Electric vehicles • Fuel cell vehicles <br> - Natural gas vehicles (complying with 2018 emission standards) <br> - Plug-in hybrid vehicles |  | @ Initial \& first vehicle inspections | Exempt (1) |  |  |  |  |  |
| - Clean diesel passenger cars (complying with 2009 or 2018 emission standards) |  |  | Exempt (2), (4) |  |  |  |  |  |
| Gasoline vehicles/ LPG vehicles (including hybrids) | Fuel efficiency |  | 2030 Fuel Efficiency Standards (3) |  |  |  |  |  |
|  | Emissions level |  | -40\% | -30\% | -25\% | -15\% | -10\% | Compliant |
|  | Down by 50\% from 2018 standards | @ Initial vehicle inspection |  |  |  | $\%$ |  | pt (4) |

## 2. Small Trucks (GVW $\leq 2.5 \mathrm{t}$ )

|  | Requirements | When Imposed | Reductions/Exemptions |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| - Electric vehicles - Fuel cell vehicles <br> - Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission <br> standards, or complying with 2018 emission standards) <br> - Plug-in hybrid vehicles |  | @ Initial \& first vehicle inspections | Exempt (1) |  |  |  |  |
| Gasoline vehicles (including hybrids) | Fuel efficiency |  | 2015 Fuel Efficiency Standards |  |  |  |  |
|  | Emissions level |  | +5\% | +10\% | +15\% | +20\% | +25\% |
|  | Down by 75\% from 2005 standards or Down by 50\% from 2018 standards | @ Initial vehicle inspection |  |  | 50\% reduction | $75 \%$ reduction | Exempt |

3. Mid-Sized Trucks ( $2.5 \mathrm{t}<\mathrm{GVW} \leq 3.5 \mathrm{t}$ )

| Requirements |  | When Imposed | Reductions/Exemptions |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| - Electric vehicles•Fuel cell vehicles <br> - Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission <br> standards, or complying with 2018 emission standards) <br> - Plug-in hybrid vehicles |  | @ Initial \& first vehicle inspections | Exempt (1) |  |  |
|  | Fuel efficiency <br> Emissions level |  | 2015 Fuel Efficiency Standards |  |  |
|  |  |  | +5\% | +10\% | +15\% |
| Gasoline vehicles (including hybrids) | Down by 75\% from 2005 standards or Down by 50\% from 2018 standards | @ Initial vehicle inspection | $\begin{gathered} 50 \% \\ \text { reduction } \end{gathered}$ | $\begin{aligned} & 75 \% \\ & \text { reduction } \end{aligned}$ | Exempt |
|  | Down by 50\% from 2005 standards or Down by $25 \%$ from 2018 standards |  | $\begin{gathered} \text { No } \\ \text { incentive } \end{gathered}$ | $\begin{gathered} 50 \% \\ \text { reduction } \end{gathered}$ | $\begin{gathered} 75 \% \\ \text { reduction } \end{gathered}$ |
| Diesel vehicles (including hybrids) | NOx and PM emissions down by $10 \%$ from 2009 standards or Compliant with 2018 emission standards |  | $\begin{aligned} & 50 \% \\ & \text { reduction } \end{aligned}$ | $\begin{aligned} & 75 \% \\ & \text { reduction } \end{aligned}$ | Exempt |
|  | Compliant with 2009 emission standards |  | $\begin{gathered} \text { No } \\ \text { incentive } \end{gathered}$ | $\begin{gathered} 50 \% \\ \text { reduction } \end{gathered}$ | $\begin{gathered} 75 \% \\ \text { reduction } \end{gathered}$ |

4. Small and Mid-Sized Buses (GVW $\leq 3.5 t$ )

| Requirements |  | When Imposed <br> @ Initial \& first vehicle inspections | Reductions/Exemptions |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| - Electric vehicles • Fuel cell vehicles <br> - Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission standards) <br> - Plug-in hybrid vehicles |  |  | Exempt (1) |  |  |
| Emissions level Fuel efficiency |  |  |  | Efficiency |  |
|  |  |  | Compliant | +5\% | +10\% |
| Gasoline vehicles (including hybrids) | Down by 75\% from 2005 standards or Down by 50\% from 2018 standards | @ Initial vehicle inspection | $\begin{aligned} & 75 \% \\ & \text { reduction } \end{aligned}$ | Exempt |  |
|  | Down by 50\% from 2005 standards or Down by 25\% from 2018 standards |  | $\begin{gathered} 50 \% \\ \text { reduction } \end{gathered}$ | $\begin{gathered} 75 \% \\ \text { reduction } \end{gathered}$ | Exempt |
| Diesel vehicles (including hybrids) | NOx and PM emissions down by 10\% from 2009 standards or Compliant with 2018 emission standards |  | 75\% | Exempt |  |
|  | Compliant with 2009 emission standards |  | $\begin{gathered} 50 \% \\ \text { reduction } \end{gathered}$ | $\begin{gathered} 75 \% \\ \text { reduction } \end{gathered}$ | Exempt |

5. Heavy-Duty Trucks and Buses (GVW>3.5t)

| Requirements |  | When Imposed | Reductions/Exemptions |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| - Electric vehicles • Fuel cell vehicles <br> - Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission standards) <br> - Plug-in hybrid vehicles |  | @ Initial \& first vehicle inspections | Exempt (1) |  |  |
| Diesel vehicles (including hybrids) | Fuel efficiency |  | 2015 Fuel Efficiency Standards |  |  |
|  | Emissions level |  | +5\% | +10\% | +15\% |
|  | Compliant with 2016 emission standards | @ Initial vehicle inspection | $\begin{gathered} 50 \% \\ \text { reduction } \end{gathered}$ | 75\% reduction | Exempt |
| (1) An initial inspection is mandated for a new venicle purchase; exemption at the time of first vehicle inspection post-purchase applies only when the new inspection certificate is issued within 15 days following exniation of the eld certificate <br>  fuel efficiency standards will also be exempt at the time of first vehicle inspection post-purchase (exemption applies only when the new inspection certificate is issued within 15 das) following expiration of the old certificate). |  |  |  |  |  |

ENVIRONMENTAL PERFORMANCE-BASED TAX REDUCTIONS/EXEMPTIONS

## Period in effect: April 1, 2021 through March 31, 2023.

-rom October 1, 2019, an automotive environmental performance-based tax came into effect as an adjunct provision to the automobile tax and the mini-vehicle tax. It is imposed at the time of vehicle (passenger car, mini-vehicle, heavy-duty vehicle, etc.) purchase and calculated on the basis of the vehicle's environmental (i.e., fuel efficiency, emissions) performance and its purchase price.
The tax applies to both new and used vehicles, with the exception of vehicles purchased for $¥ 500,000$ or less, which are exempted from the tax
The fuel efficiency and other environmental performance criteria on the basis of which the tax's varying rates (e.g., from $0 \%$ to $3 \%$ for passenge vehicles and from $0 \%$ to $2 \%$ for commercial vehicles and mini-vehicles) have been determined are in line with criteria established in Japan's Energ, Conservation Law. Highly fuel-efficient as well as electrified and other designated vehicles are exempted from the tax
-For vehicles purchased through December 31, 2021, a provisional $1 \%$ reduction on this tax is in application.
Environmental Performance-Based Tax Reductions/Exemptions for Private-Use Passenger Vehicles (including mini- and used vehicles)

(1) For clean diesel passenger cars purchased on or after April 1,2022 , only vehicles complying with 2020 fuel efficiency standards and $c$ co
standards will be exempt. (2) Only wehices complying with 2020 tuel efficiency standards are ligible for the reductionsexemptions shown here.

TONNAGE TAX \& ENVIRONMENTAL PERFORMANCE-BASED TAX REDUCTIONS for Vehicles Equipped with Advanced Safety Feature (ASV) Systems
Period in effect

FISCAL 2021 \& 2022 SPECIAL AUTOMOBILE TAX REDUCTIONS (Passenger Cars and Trucks \& Buses)

| Requirements |  |  |  | Reduction (1) |
| :---: | :---: | :---: | :---: | :---: |
| Passenger Cars | For private use For commercial use | - Electric vehicles • Fuel cell vehicles • Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission standards, or complying with 2018 emission standards) • Plug-in hybrid vehicles |  | 75\% reduction |
|  | For commerial use | Gasoline vehicles/LPG vehicles (including hybrids) | Compliant -10\% with 2030 fuel efficiency standards, with emissions down by $75 \%$ from 2005 standards or down by $50 \%$ from 2018 standards (2) |  |
|  |  | Diesel vehicles (including hybrids) | Compliant -10\% with 2030 fuel efficiency standards and Compliant with 2009 or 2018 emission standards (2) |  |
|  |  | Gasoline vehicles/LPG vehicles (including hybrids) | Compliant -30\% with 2030 fuel efficiency standards, with emissions down by 75\% from 2005 standards or down by 50\% from 2018 standards (2) | 50\% reduction |
|  |  | Diesel vehicles (including hybrids) | Compliant -30\% with 2030 fuel efficiency standards and Compliant with 2009 or 2018 emission standards (2) | \% reduction |
| Trucks \& Buses |  | - Electric vehicles • Fuel cell vehicles • Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission standards, or complying with 2018 emission standards) • Plug-in hybrid vehicles |  | 75\% reduction |

FISCAL 2021 \& 2022 SPECIAL MINI-VEHICLE TAX REDUCTIONS (Minicars and Mini-Trucks) *

| Requirements |  |  |  | Reduction (1) |
| :---: | :---: | :---: | :---: | :---: |
| Minicars | For private use For commercial use | - Electric vehicles • Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission standards, or complying with 2018 emission standards) |  | 75\% reduction |
|  | For commerial use | Gasoline vehicles (including hybrids) | Compliant -10\% with 2030 fuel efficiency standards, with emissions down by $75 \%$ from 2005 standards or down by $50 \%$ from 2018 standards (2) | 50\% reduction |
|  |  |  | Compliant -30\% with 2030 fuel efficiency standards, with emissions down by $75 \%$ from 2005 standards or down by 50\% from 2018 standards (2) | 25\% reduction |
| Mini-Trucks |  | - Electric vehicles • Natural gas vehicles (with NOx emissions down by $10 \%$ from 2009 emission standards, or complying with 2018 emission standards) |  | 75\% reduction |

## Automobile-Related Taxes Are Onerous

Consider the case of a passenger car costing 2.42 million yen when purchased new and providing 13 years of service to the original owner for private use. During that period, six different categories of taxes (including consumption tax at the time of vehicle purchase and on fuel) will be assessed on the owner/user, amounting to a grand total of roughly 1.8 million yen. In addition to these various taxes, the user will also be required to pay onerous expressway tolls, automobile insurance premiums (mandatory and optional), a recycling fee, periodic inspection fees, and maintenance costs.

TAXES ASSESSED ON PASSENGER CAR OWNERSHIP AND USE (PRIVATE) IN JAPAN (assuming a 13-year service life)

### 81.99 Million People Hold Driver's Licenses

At the end of 2020 there were 81.99 million people, or 44.60 million men and 37.39 million women, holding valid driver's licenses in Japan. The number of driver's licenses held totalled 126.08 million (with one count allotted to each vehicle category covered, whenever a license covers multiple vehicle categories). By license category, Class 2 licenses were held by 1.88 million people, or 1.82 million men and 70,000 women, and Class 1 licenses by 124.19 million people, or 79.31 million men and 44.88 million women.

## Classifications According to the Road Vehicles Act and the Road Traffic Act

Japan classifies motor vehicles according to the provisions of two basic laws: the Road Vehicles Act and the Road Traffic Act. Road Vehicles Act classifications are used for registration statistics, vehicle inspection, and related maintenance and repair, while Road Traffic Act classifications determine the different categories of driver's licenses. Vehicle registration number/character combinations are determined by vehicle type and usage in accordance with Road Vehicles Act designations. "Vanity" number plates are obtainable nationwide and illustrated vanity plates are obtainable in designated regions.

- SIGNIFICANCE OF VEHICLE REGISTRATION DATA \& NUMBER PLATE TYPES

## Global Manufacturing Operations Expand Their Range

 transmissions, as well as finished vehicles of some models, are exported to Japan and other destinations.

GEOGRAPHICAL DISTRIBUTION OF JAPANESE AUTOMAKERS' OVERSEAS PRODUCTION BASES

JAPANESE AUTOMAKERS" OVERSEAS PRODUCTION BASES: Number of Plants by Country \& Items Produced

## Japanese Automakers' Overseas Production Finishes at 15.38 Million Automobiles and $\mathbf{2 0 . 1 6}$ Million Motorcycles

The global operations of Japanese automobile manufacturers continue to grow, focusing on on-site manufacturing to meet local needs. Whether as independent operations, joint ventures or technical tie-ups, local manufacturing activities are conducted in numerous countries around the world (see page 24). Japanese automakers' overseas production in 2020 totalled 15.38 million automobiles and 20.16 million motorcycles.

OVERSEAS PRODUCTION BY JAPANESE
MOTORCYCLE MANUFACTURERS

## Japanese Automakers Forge Extensive International Alliances

With economic globalization, Japanese automobile manufacturers have rapidly adapted to the needs of individual markets, not only by shifting production to those markets but also by forging extensive alliances with overseas manufacturers. Various forms of partnership currently exist among Japanese, U.S. and European automakers-including capital and technical tie-ups, joint R\&D and production operations, and cooperative sales ties-and such arrangements are expanding yearly. With the rapid growth of motorization in China and Southeast Asia, Japanese automakers have been actively building relationships with local manufacturers there on the basis of capital tie-ups and the supply of production as well as environment- and safety-related technologies.

At March 31, 2021

## Motor Vehicle Production Worldwide Declines to 77.62 Million Units

In 2020 worldwide motor vehicle production (excluding motorcycles) dropped $15.4 \%$ from the previous year to a total of 77.62 million units.

## Nearly 1．5 Billion Motor Vehicles in Use Worldwide

There were over 1.49 billion motor vehicles（excluding motorcycles）in use worldwide in 2019，equivalent to 193 motor vehicles per 1,000 inhabitants or one vehicle for every 5.2 persons．Motorcycle density in recent years has been particularly high in Indonesia and Malaysia，with one motorcycle in use for every two persons；in Thailand，with one in use for every three persons；in Greece，with one in use for every six persons；and in Italy，with one in use for every seven persons．In Japan，one motorcycle is in use for every 12 persons．

## Automobile Customs Tariffs, EPAs-FTAs

ollowing repeated reductions in tariff rates, import tariffs in Japan on finished motor vehicles and auto parts were abolished in 1978. Many other countries continue to impose tariffs on imported vehicles: for example, the United States imposes a $25 \%$ tariff on imported trucks and China levies a $15 \%$ tariff on finished vehicles. Aiming to abolish customs tariffs and thereby to liberalize and facilitate trade and investment, the Japanese government promotes the establishment of economic partnership agreements (EPAs) and free trade agreements (FTAs). In recent years, Japan has signed several multilateral trade accords including the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) with ten countries and the Japan-European Union EPA, thereby significantly expanding the scope of its international trade agreements.

The 1st Tokyo Motor Show, Hibiya Park, 1954

In 1954, as Japan's post-war reconstruction was nearing completion, the first Tokyo Motor Show was held at Hibiya Park in central Tokyo, premised on the notion that an international motor show was needed to resuscitate the Japanese motor vehicle industry.

The eth Tokyo Motor Show,
Japan Trade Center, 1959

The 28th Tokyo Motor Show
Makuhari Messe, 1989

From that point on, the Tokyo Motor Show grew in step with the development of Japan's automobile industry. In 1959 the show moved to the Japan Trade Center located in Tokyo's Harumi area, then, thirty years later, in 1989, to the Nippon Convention Center (Makuhari Messe) in Chiba Prefecture. In 2011 it moved again, to its current venue at Tokyo Big Sight (officially known as Tokyo International Exhibition Center) in Ariake, where it has established itself as a top-level international motor show on a par with those in Europe and the United States.

The 46th Tokyo Motor Show, the event's most recent edition, held in 2019, was conceived as a showcase for new mobility, marking the automotive industry's strategic transition into the future. The show's organizers expanded the scope of participation to include representatives of other industries, thereby turning the exhibition into a multi-industry event, with 192 companies and organizations addressing the theme of future mobility. A total of 1.3 milion people visited the 46th Tokyo Motor Show, with attendance rates for children, young people, and women showing significant increases. As visitors experienced first-hand the show's wide-ranging programs and activities, visible delight was also on display.

A new edition of the show was scheduled to be held in the autumn of 2021, but owing to the global COVID-19 pandemic it was decided that ensuring a safe and secure environment for visitors would be difficult. Organizers are now working towards holding the next show in the autumn of 2023 on a "green and digital" theme, with expanded multi-industry participation in what promises to be a thoroughly exciting event. Stay tuned!
*The Tokyo Motor Show Drone Show was performed with the permission, approval and guidance of the East Japan Civil Aviation Bureau of the Ministy of Land, Infrastructure, Transport and
Tourism, the Tokyo Coast Guard Office of the 3 rd Regional Coast Guard Headquarters of the Japan Coast Guard, and the Bureau of Port and Harbor of the Tokyo Metrooplitan Government.
